# IOS (Integrated One Shot) Wiring Diagram

NOTE: Turning the blue knob on the delay relay clockwise will increase the time the pump stays on (Aprox. 6min maximum).

NOTE: Both lights on the switch will light up any time the pump is running. Push the momentary switch down to trigger the timed pump, push switch up to power pump continuously. Be careful not to overflow your tank if you choose this option.

NOTE: There will be ample wire scraps to wire between the switch and the timer relay. Color is unimportant, don't hesitate to use a different colored wire than what's on the diagram.
